Passion for excellence in clean air solutions.

CASE STUDY NAME

CENTRAL DUST COLLECTOR FOR MANY GRINDING TABLES

Case Study Facts

Products:	T-2000 Grinding tables AC-403 Filter units	Process:	Manual grinding

Customer: Altty GmbH - Germany

Requirements & Challenges

There were 8 workplaces in this metal working company in Germany, where manual grinding operators are **continuously grinding** or brushing parts. The work-cycle is mostly two shifts per day. The materials that are grinded are made of whether stainless steel or carbon steel.

A high number of semi-products are processed through **the grinding shop**. As a result of the tough working conditions, **a high amount of smoke and dust** containing a lot of burning spark particles are generated. A robust filtration and extraction solution was necessary.

SOLUTION

VANTERM with its dealer in Germany, installed T-2000 model **grinding tables**, in order to provide a smooth extraction and an efficient capturing of the dust particles that are generated from the manual grinders. Additionally, AC-403 **stationary filter units** have been installed as the **central filtration** units. In order **to save energy**, the filter units have been equipped with **VFD – inverter control** systems.
